Excerpt from **Geostrophic Vortices on a Sphere** A thin spherical layer of an incompressible, inviscid fluid which is held on the surface of a rotating ball by gravitation can be taken for some purposes as an approximation to the Earth's atmosphere. The analysis of the two dimensional vortical motion in such a layer should be useful for the understanding of certain observed meteorological phenomena. In a previous report a linearized analysis was presented under the assumption that the outer surface of the layer is a sphere always concentric to the ball representing the Earth. This report presents a linear analysis in which the outer surface of the fluid layer is allowed to be free but the Coriolis force is assumed to be independent of latitude. This assumption defines a motion which can be regarded as a first approximation to the actual motion even if the fluid layer is not confined to a narrow band bounded by two circles of latitude.
