

## A Course in Mathematics, for Students of Engineering and Applied Science Volume N . 1

Filesize: 6.1 MB

### **Reviews**

*It is an incredible publication i actually have actually go through. I really could comprehended everything out of this composed e pdf. Its been designed in an exceedingly simple way and is particularly just following i finished reading this publication where actually changed me, alter the way i think.*

To save **A Course in Mathematics, for Students of Engineering and Applied Science Volume N . 1** PDF, remember to follow the link listed below and save the ebook or get access to additional information which are highly relevant to A COURSE IN MATHEMATICS, FOR STUDENTS OF ENGINEERING AND APPLIED SCIENCE VOLUME N . 1 ebook.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 72 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1907 Excerpt: . . . suggests a method of finding the tangent to any curve represented by an equation of the second degree, the slope of the tangent being given. For if  $m$  of the required tangent is known, its equation may be written  $y = mx + b$ , where  $b$  is not known. According to the definition of a tangent, however,  $b$  must have such value that the points of intersection of straight line and curve shall be coincident. This condition enables us to determine  $b$ , as shown in the following examples. Ex. 1. Find the equation of the tangent to the parabola  $3x^2 - 2y = 0$ , the slope of the tangent being 2. Since the slope of the tangent is 2, its equation may be written  $y = 2x + b$ . Substituting this value of  $y$  in the equation of the parabola, we have the equation  $3x^2 - 4x - 2b = 0$ . Since the line is to intersect the curve in two coincident points, this equation must have equal roots. The condition for equal roots, by 37, is  $(4)^2 - 4(3)(-2b) = 0$ , whence we find  $b = -\frac{2}{3}$ . Therefore the required tangent is  $y = 2x - \frac{2}{3}$ , or  $6x - 3y - 2 = 0$  (fig. 98). Ex. 2. Find the equation of the tangent to the ellipse  $x^2 + 4y^2 = 4$ , the slope of the tangent being  $\frac{1}{2}$ . The equation of the tangent is  $y = \frac{1}{2}x + b$ . Substituting this value of  $y$  in the equation of the ellipse, we have By this same method the following formulas for a tangent..
