

## Modelling and Simulation of Nanofiltration Membranes

Filesize: 8.35 MB

### **Reviews**

*Excellent e-book and useful one. It is written in straightforward phrases rather than confusing. I am just very happy to explain how here is the finest publication I have got read through in my very own lifestyle and might be the greatest book for possibly.*  
*(Viva Schuster)*

## MODELLING AND SIMULATION OF NANOFILTRATION MEMBRANES

To read **Modelling and Simulation of Nanofiltration Membranes** PDF, you should access the link under and save the file or have access to additional information which might be related to MODELLING AND SIMULATION OF NANOFILTRATION MEMBRANES ebook.

Cuvillier Verlag Dez 2007, 2007. Taschenbuch. Book Condition: Neu. 211x146x17 mm. Neuware - Nanofiltration (NF) is a relatively recent membrane process and offers a plethora of application areas due to its selective removal for ions and removal of organic matter above 200 g/mol molar mass. Application fields enlarged substantially in the last 25 years. Accordingly, there is an increasing need for process design and optimisation tools. Therefore, current research studies focus on a better understanding of mass transport phenomenon as well as the application and enhancement of the existing models to the real process streams. In this thesis work, characterisation of NF membranes and investigations of their mass transport phenomenon through both experimental and modelling studies were of concern. For these purposes, flat sheet samples of four commercially available membranes were selected. Since the performance of a NF membrane is related to its structural and charge properties, membrane characterisation studies by microscopy, contact angle and electrokinetic measurements were conducted. A systematic experimental program was applied covering a wide spectrum of feed streams concerning both charged and uncharged solutes. Particularly charged streams regarding single salts and their mixtures were emphasised. Moreover, the effects of the operating conditions and the solution pH on membrane performances were investigated. Standard performance characterisation experiments, consisting of pure water permeability, organic and single salt rejection measurements, gave initial information on the membrane charge and performance characteristics. In mixture solutions of salts, distinctive behaviours of membranes to different ion types at different combinations were observed. Furthermore, artificial seawater experiments were conducted in order to determine the convenience of the considered NF membranes for this recently recognised process as an intensification step in the pre-treatment of seawater. A practical tool was developed for the performance description and prediction purposes. For this purpose, currently available models were scrutinized. A physical model, based on...
