Springer-Verlag Berlin and Heidelberg GmbH & Co. K. Paperback. Condition: New. 282 pages. Dimensions: 9.0in. x 6.1in. x 0.7in. This book focuses on the analysis of dose-response microarray data in pharmaceutical settings, the goal being to cover this important topic for early drug development experiments and to provide user-friendly R packages that can be used to analyze this data. It is intended for biostatisticians and bioinformaticians in the pharmaceutical industry, biologists, and biostatistics/bioinformatics graduate students. Part I of the book is an introduction, in which we discuss the dose-response setting and the problem of estimating normal means under order restrictions. In particular, we discuss the pooled-adjacent-violator (PAV) algorithm and isotonic regression, as well as inference under order restrictions and non-linear parametric models, which are used in the second part of the book. Part II is the core of the book, in which we focus on the analysis of dose-response microarray data. Methodological topics discussed include: Multiplicity adjustment Test statistics and procedures for the analysis of dose-response microarray data Resampling-based inference and use of the SAM method for small-variance genes in the data Identification and classification of dose-response curve shapes Clustering of order-restricted (but not necessarily monotone) dose-response profiles Gene set analysis to facilitate the interpretation of microarray results Hierarchical Bayesian models and Bayesian variable selection Non-linear Bayesian models for dose-response microarray data Multiple contrast tests Multiple confidence intervals for selected parameters adjusted for the false coverage-statement rate All methodological issues in the book are illustrated using real-world examples of dose-response microarray datasets from early drug development experiments. This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.
