Many very valuable treatises have been published on this subject; but from their being either almost exclusively practical or exclusively mathematical, and from the physical parts of the science being detached from the theoretical, the student cannot derive much real advantage from them, unless previously acquainted with the principles of the science, and with the Differential and Integral Calculus; for unless so previously prepared, he must content himself with adopting results without being thoroughly acquainted with the processes by which they are obtained. It is obvious that this method of arriving at an end, without understanding the means, may employ, but cannot properly instruct the mind. I have endeavoured in the following treatise to develop the principles of the science with the use of none but the most elementary mathematics; so that the student, who now either partially or wholly neglects this beautiful branch of Natural Philosophy, from the uninviting character which Analysis presents to those who are not familiar with it, may proceed to its study, with the knowledge of a few propositions of Geometry, Algebra and Mechanics, and for understanding by far the greater portion of the subject even that amount of previous knowledge is not necessary.
