RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 172 pages. Original publisher: Washington, D. C. : United States Fish and Wildlife Service, 2004 OCLC Number: (OCoLC)70670086 Subject: Tidewater goby -- United States. Excerpt: . . . often end up only 1 to 2 meters (3. 3 to 6. 6 feet) deep despite a width of 30 to 150 meters (100 to 500 feet) or more (Habel and Armstrong 1977). This pattern holds true even in larger systems, such as the Santa Ynez River and Santa Margarita River. A central channel, excavated by brief winter flows in these larger streams, will be another meter (3. 3 feet) or so deeper than most of the lagoon. Half or more of the substrate of the lagoon will be soft sand, with mud in backwaters. Figure 4. Santa Clara River, Ventura County, after a storm-Elevated lateral backwaters often breach-event flood only in winter. Without these deeper, backwater habitats (e. g. lateral sloughs), tidewater gobies can be flushed out by heavy winter floods (Jerry Smith, Biology Department, San Jose State University, pers. comm. 2004), resulting in the extirpation of some populations (however, see next paragraph). Some rocks or gravel may be present, mostly at the upper (inlet) and lower (outlet) ends where constricted flow directly scours the channel. These rocks are exposed by high water flow. Declining flows continue to bring in sand that often covers the rocks by early spring. Lafferty et al. (1999a) monitored post-flood persistence of 17 tidewater goby populations in Santa Barbara and Los Angeles Counties during and after the heavy winter floods of 1995. All 17 populations persisted after the floods, and no significant changes in...
