Springer. Paperback. Condition: New. 308 pages. Dimensions: 9.2in. x 6.1in. x 0.8in. This volume is about automation - automation in design, automation in manufacturing, and automation in production. Automation is essential for increased productivity of quality products at reduced costs. That even partial or piecemeal automation of a production facility can deliver dramatic improvements in productivity has been amply demonstrated in many a real-life situation. Hence, currently, great efforts are being devoted to research and development of general as well as special methodologies and tools for automation. This volume reports on some of these methodologies and tools. In general terms, methodologies for automation can be divided into two groups. There are situations where a process, whether open-loop or closed-loop, is fairly clearly understood. In such a situation, it is possible to create a mathematical model and to prescribe a mathematical procedure to optimize the output. If such mathematical models and procedures are computationally tractable, we call the corresponding automation - algorithmic or parametric programming. There is, however, a second set of situations which include processes that are not well understood and the available mathematical models are only approximate and discrete. While there are others for which mathematical procedures are so complex and disjoint that they are computationally intractable. These are the situations for which heuristics are quite suitable for automation. We choose to call such automation, knowledge-based automation or heuristic programming. This item ships from multiple locations. Your book may arrive from Roseburg,OR, La Vergne,TN. Paperback.
