This conclusion was confirmed, within the errors of observation, by measurements just before and after the close of excitation. The only previous instances where this relation has been experimentally established so far as we know are to be found in Waggoner's studies of phosphorescence of short duration and in our recent paper on the luminescence of kunzite. 3 Where, as in these measurements, determinations have to be made through a very wide range and at exceedingly low intensities, doubts naturally arise as to the accuracy of the data for the lowest values. That in the present case the foot of the decay curves, where the brightness is reduced to a few thousandths of the initial intensity, is determined with a precision of the same order as that for higher values may be seen from Fig. 3 (Curve BB), in which the portion of the decay curve applying to the second process, i. e. , from .001 second onward, is plotted on a scale in which the ordinates for intensity are multiplied by ten. It will be noted that the observations fit the curve as closely as can be expected in work of this character. This is a fact quite in accord with previous 1 Nichols, I. C. Waggoner, Physical Review, XXVII. , p. 209. Nichols and Howes, Physical Review (2), IV. , p. 26. experiences in the domain of luminescence where observations made at the very lowest intensities which would permit of distinguishing the...
